

WHAT IS SOIL

WHAT'S THE WEATHER GOT TO DO WITH IT?

The type and quality of soil in an area helps determine what plants, if any, will grow there. Soil temperature is also very important to plant growth. Soil temperature helps determine the “rate” of plant growth. In other words, the temperature of soil helps determine if certain plants will grow slowly, quickly, or even survive.

Find out the names of five plants that grow where the temperature is warm year round.

1. _____
2. _____
3. _____
4. _____
5. _____

Find out the names of five plants that grow where the temperature is warm part of the year, and cold part of the year.

1. _____
2. _____
3. _____
4. _____
5. _____

Find out the names of three plants that grow where the temperature is cold year round.
